The paper reviews recent work by the authors in the modeling of strain-softening arising from damage, such as cracking, in heterogeneous brittle materials. Attention is focused on the concept of localization in materials which ensure that strain-softening zones cannot localize into a region of zero volume. Localization models make it possible to achieve proper convergence ...

In which the key variables in the constitutive equations are the non-local strain $\epsilon(x) = \int_{\Omega} \epsilon(x, t) dt$ (1) and the non-local stress $\sigma(x) = \int_{\Omega} \sigma(x, t) dt$ (2) where $\sigma = T(\epsilon)$ is the constitutive law. η is the given weight function.

Constitutive Laws for Engineering Materials

The Bingham constitutive law describes materials that do not deform if the stress is below a certain stress yield τ_y , also known as yield stress or plasticity yield; above this yield the material behaves like an incompressible viscous fluid. For this reason, the Bingham constitutive law is said to model viscoplastic fluids. The Cauchy stress tensor for Bingham fluids can be written in the form

Description. High-technology industries using plastic deformation demand soundly-based economical decisions in manufacturing design and product testing, and the unified constitutive laws of plastic deformation give researchers a guideline to use in making these decisions. This book provides extensive guidance in low cost manufacturing without the loss of product quality.

Unified Constitutive Laws of Plastic Deformation - 1st Edition

Thermodynamic restrictions: Constitutive laws usually start by expressing the specific internal or free energy, specific entropy, and heat flux of a material in terms of the temperature, parameters characterizing shape changes, and any internal state variables (such as yield stress) that characterize the material state. These have the general form

Abstract. In this paper, a data-driven approach for constructing elastoplastic constitutive law of microstructured materials is proposed by combining the insights from plasticity theory and the tools of artificial intelligence (i.e., constructing yielding function through ANN) to reduce the required amount of data for machine learning.

The constitutive relation of this material has the general form: $\sigma = F(\epsilon)$ (2.13) where $F(\epsilon)$ is the elastic response function of the material. The behavior of such materials is both reversible and path independent in the sense that stresses are uniquely determined by the current state of strain (or vice versa).
